1. Problem Statement and Target Users

- **Problem Statement:** SIT students have **limited** opportunities to discover and meaningfully interact with new people beyond **face-to-face** encounters, making it **difficult** to form **new social and romantic relationships**.
- **Background:** Despite being part of a **large student community**, students may only interact with a **small** group of people through their **classes, clubs, or existing social circles**. As a result, many students may not have the opportunity to meet or get to know others across the **wider SIT community**.
- **Objective:** To create a programme that provides SIT students with more opportunities to discover, interact with, and get to know **new** people, with the aim of **encouraging meaningful social and romantic connections**.
- **Target Audience:** SIT Students

2. User Inputs - Link to Google Sheets

Background Information:

- Name, Birthday (DD/MM/YYYY) → Zodiac & Ba Zi, Religion, MBTI → 16 Personalities
- Year, Course, Student ID

Personal Information:

- Sexual Orientation: Heterosexual/ Homosexual/ Bisexual
- Here For: Friends/ Relationship
- Expectations in Relationships

Extracurriculars:

- Current CCAs/ Events Joined (in SIT), Hobbies, Outside Interest Group

3. Use of AI - Claude

AI Feature	How AI is Utilized	AI Output/Recommendation
Compatibility Matching	AI will analyse user's profiles, to identify similarities between two students.	Generates a Compatibility Score and highlights key areas of similarity.
Personalised Match Recommendations	AI analyses a user's profile together with profiles they liked or skipped, to better understand their preferences over time.	Recommends students who are more likely to be compatible with a user and improves on future matchmaking suggestions.
Conversations & Date Suggestions	AI uses information from both matched user's profiles and shared interests to generate personalised suggestions.	Provides both users with: ● Conversation Starters ● Common-Interest Topics ● Possible Date Activities ● Relevant SIT Events

AI Feature	How AI is Utilized	AI Output/Recommendation
Content Safety & Moderation	AI analyses messages and profile content for potentially inappropriate behavior.	Flags potentially harmful content for review and warns users where appropriate. Repeated or serious violations are escalated.
Profile Image Verification	AI analyses uploaded profile images for signs of manipulated, AI-generated or duplicated images.	Assigns a risk/verification result and flags suspicious images for further review rather than automatically banning the student.
Match Feedback & Compatibility Analytics	AI analyses feedback after matches, such as whether users continued chatting or mutually liked each other.	Identifies patterns associated with successful matches and uses them to improve future compatibility recommendations.

4. Business Rules

SIT Student Validation	Only verified SIT students may create an account. Users must register using their SIT student email / Student ID .
Account/Profile Eligibility	A user must have a verified account and completed profile before appearing in matchmaking recommendations.
Compatibility Range	Matches will be according to the AI-generated compatibility score: ● 85 - 100%: High Compatibility ● 70 - 84%: Shown after high compatibility users ● Below 70%: Low Compatibility; Lower Priority
Match Status	“Accept”, “Reject” : Social media handles will be revealed once a match is created.
Flag System (Human-In-The-Loop System)	AI will assign potentially inappropriate or suspicious content a risk/confidence score . Low-confidence cases will not automatically penalise users. Content that exceeds a defined threshold will be flagged for human review before disciplinary action is taken.
Violation System	Violations will be recorded against the user's account: ● 1st Violation: In-App Warning ● 2nd Violation: Email Warning ● 3rd Violation: Escalate to Administrator
Match Recommendation Rule	Users who have already rejected, blocked, or reported each other will not be recommended to one another again. Existing matches should also be excluded from new recommendations.
Blocking & Reporting Rule	When a user blocks another user, both users will be removed from each other's recommendations. Reports will be stored for administrator review.
